

ABSTRACT OF THE DISCLOSURE

In the case of an aircraft comprising a cargo compartment (2) with a cargo-compartment floor (3), supporting elements, in particular floor beams (16) to support the cargo-compartment floor (3) and to be connected to a body (1) or a skin (1) of the aircraft, and with functional units, in particular water tanks, waste-water tanks, EE racks (56) or similar electronic components, it is proposed that the functional units be disposed on pallets (70) or similar supporting structures in order to transport the functional units into the cargo compartment (2), said pallets (70) comprising fixation devices (71) for fixed attachment to the cargo-compartment floor (3). By this means the assembly of an aircraft, as well as its reconstruction, is considerably facilitated.
